SURGEON: Saeed Ahmed, MD

TYPE OF PROCEDURE: ~~Colonoscopy~~ 42 EGD

INDICATION FOR THE PROCEDURE: Iron-deficiency anemia.

CONSENT: An informed consent was obtained after explaining the procedure, side effects, complications, and alternatives of the procedure.

PROCEDURE: After informed consent, the patient was placed in the left lateral position. Sedation was given using MAC anesthesia. Once sedated, Olympus GIF-160AL gastroscope was inserted into the oropharynx and then advanced under direct visualization into the esophagus, stomach, and up to the second part of the duodenum. The scope was then pulled back evaluating the mucosal lining. In the stomach, retroflexion was performed. The patient tolerated the procedure well. There were no immediate complications.

FINDINGS:

1. Esophagus: The esophagus appears normal without evidence of ulcerations, erosions, edema, or erythema. Squamocolumnar junction was located at 40 cm from the incisors and it was normal.
2. Stomach: There was evidence of edema, erythema and a few erosions in the antrum. Biopsies were obtained and sent for surgical pathology. The body, fundus, and cardia appears normal.
3. Duodenum: There was evidence of duodenitis with erosions, edema, erythema in the bulb. The second and third part of the duodenum appear normal. I took random biopsies of the second and third part, as well as from the duodenal bulb for workup for his anemia and sent for surgical pathology.

IMPRESSION:

1. Normal esophagus.
2. Erosive antral gastropathy, biopsies obtained.
3. Duodenitis in the bulb. Biopsies obtained.

INDICATION FOR THE PROCEDURE: Microcytic anemia, iron-deficiency anemia.

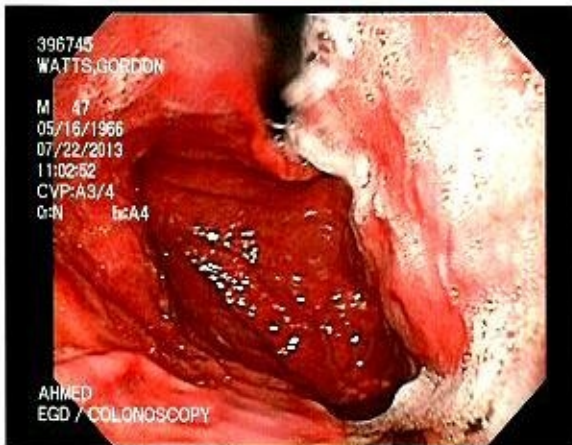

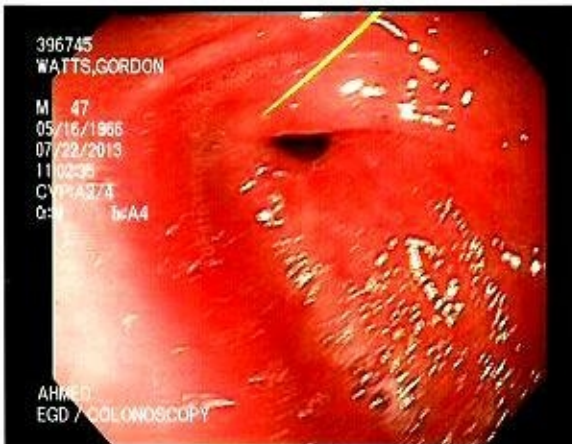

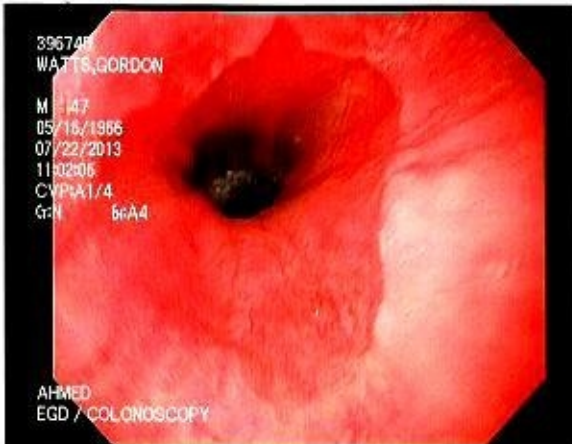

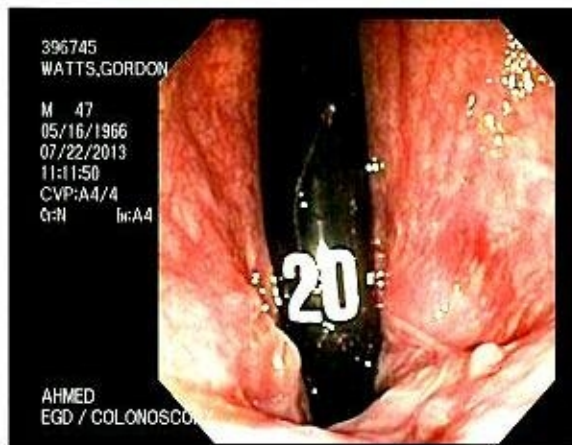

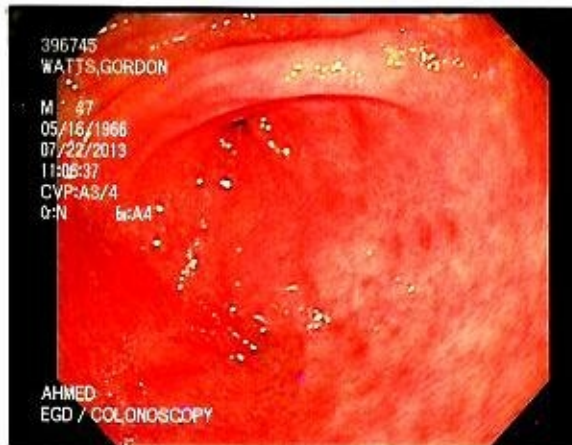

CONSENT: An informed consent was obtained after explaining the procedure, side effects, complications, and alternatives of the procedure.

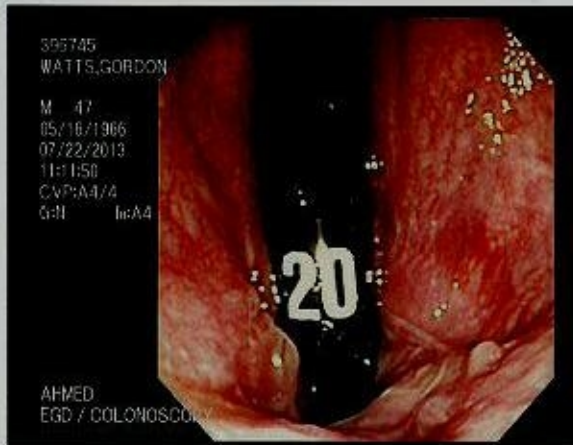

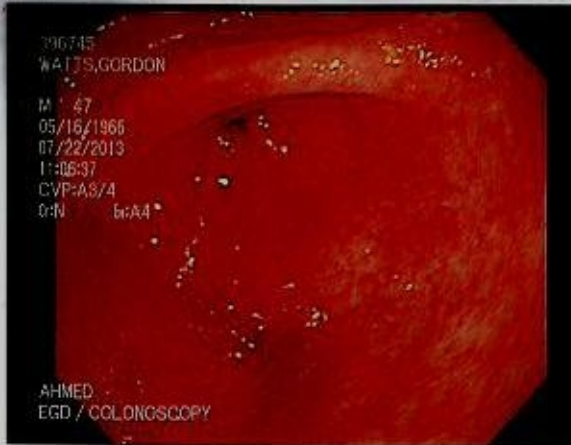

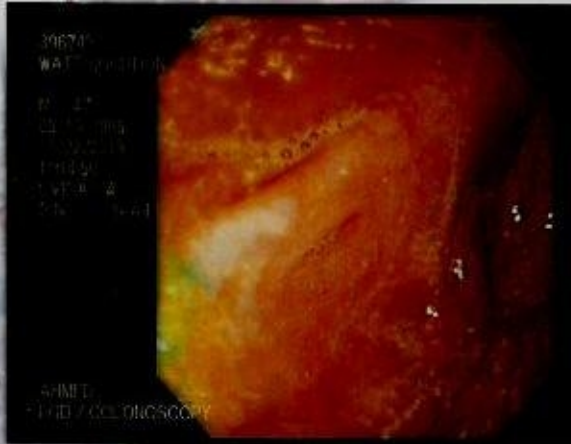

PROCEDURE: After an informed consent, the patient was placed in the left lateral position. Sedation was given using MAC anesthesia. Once sedated, an EGD was performed. Please review separate EGD report for details. After the EGD, an Olympus PCF-160AL colonoscope was inserted into the rectum, then advanced under direct visualization up to the cecum, which was identified by the ileocecal valve and appendiceal orifice. The scope was then pulled back evaluating the mucosal lining. In the rectum retroflexion was performed. The patient tolerated the procedure well. There were no immediate complications.

FINDINGS: There were internal hemorrhoids noted on retroflexion at the anorectal junction. Digital rectal examination was normal. Other than these findings the rest of the colon appears normal up to cecum. No polyps, angiodysplasias, diverticula or colitis identified.

IMPRESSION: Normal colonoscopy up to the cecum.

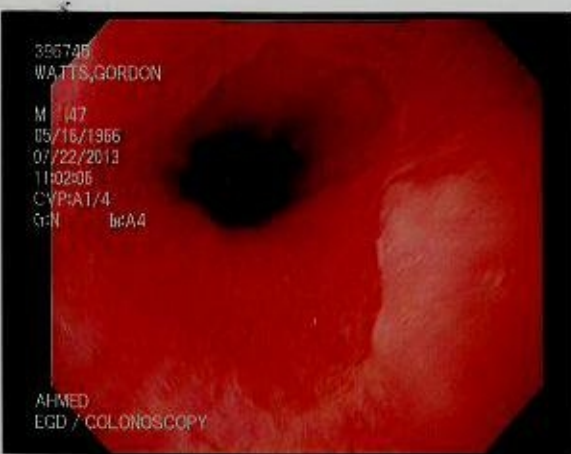

RECOMMENDATIONS: Follow up in the office in 1 to 2 weeks for followup of his EGD findings. If anemia persists, we may consider a capsule endoscopy.
